                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: RiboElavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribity1-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethy1-8-lumazine. The alpha subunit catalyzes the dismutation of 6,7-dimethy1-8-lumazine to riboflavin and 5-amino-6-(1'-D)-ribity1-amino-2,4(1H,3H)-pyrimidinedione (By similarity).

CATALYTIC ACTIVITY: 2 6,7-dimethy1-8-(1-D-ribity1)lumazine = riboflavin + 4(1-D-ribity1amino)-5-amino-2,6-dihydroxypyrimidine.

PATHWAY: Pinal steps of riboflavin synthesis.

SUBUNIT: Oligomer that consist of 3 alpha subunits and 60 beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LUXL (LUMP).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PUNCTION: NDH-1 shuttles electrons from NADH, via FMN and ironsulfur (Pe-S) centers, to quinones in the respiratory chain. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).

CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.
SUBCELLULAR IOCATION: Integral membrane protein (Potential).
SIMILARITY: TO POLYPEPTIDE 5 OF THE NADH-UBIQUINOL OXIDOREDUCTASE OF CHLOROPLASTS OR MITOCHONDRIA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sulfur (Fe-S) centers, to quinones in the respiratory chain.

Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).

CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

SUBCELLULAR LOCATION: Integral membrane protein (Potential).

SIMILARITY: TO POLYBEPTIDE 5 OF THE NADH-UBIQUINOL OXIDOREDUCTASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OF CHLOROPLASTS OR MITOCHONDRIA.

          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SPTREMBL 23:*

Publication No. US20020058607A1
IGENERAL INFORMATION: COMPOUNDS THAT INHIBIT THE INTERACTION BETWEEN
ITILE OF INVENTION: COMPOUNDS THAT INHIBIT THE INTERACTION BETWEEN
ITILE OF INVENTION: SIGNAL-TRANSDUCING PROTEINS AND THE GLGF
ITILING DATE: 1085 COMPATION: WORK TO THE GLGF
ITILING SYSTEM: PC-DOS/MS-DOS
SOFTMARE: PALENTION INTERACTION: 196
CURRENT APPLICATION NUMBER: US/08/681,219
FILING DATE: 22-UUL-196
CLASSIFICATION NUMBER: US/08/681,219
FRIEDENONE: (212) 278-0400

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                              The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         between a signal-transducing protein (STP) having the carboxy-terminal sequence (Ser/Thr)-Xaa-(Val/Ile/Leu), where Xaa = any amino acid (e.g. the present peptide), and a cytoplasmic protein (CP) containing the sequence AAW50162 or AAW50163. The composition can be used to inhibit the proliferation of cancer or virally infected cells, or induce apoptosis in cancer or viralls infected cells.

cc and protein sequences isolated from eucalyptus (Eucalyptus granus, ... cc pine (Pinus radiata also known as Monterey pine). The protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and cc development of a plant. They can be used to modify cell proliferation, cc differentiation, elongation and survival, resistance to disease and cmutrient metabolism. Examples of modifications which can be produced are cc altered fruit ripening and senescence of leaves and flowers e.g. to cd day senescence and prolong the life of cut flowers or enhance cc modifications can be used to engineer sterile plants. Other cc organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in cc forest tree species giving long stretches of valuable knot free clear cc wood which can be used in solid timber furniture and veneers.
